age estimation in the living Bone age is the degree of maturation of a child's bones. As a person grows from fetal life through childhood, puberty, and finishes growth as a young adult, the bones of the skeleton change in size and shape. These changes can be seen by x-ray. The "bone age" of a child is the average age at which children reach this stage of bone maturation.

age estimation in the living Aristotle (ca. 340 B.C.) may have been the first scientist to speculate on the use of hard parts of fishes to determine age, stating in *Historia Animalium* that "the age of a scaly fish may be told by the size and hardness of its scales." However, it wasn't until the development of the microscope that more detailed studies were performed on the structure of scales.
